

Assignment 2

API:

The screenshot shows a web browser at the URL `http://localhost:8000/docs#/default/predict_predict_post`. The interface is divided into two main sections: a top section for the `/health` endpoint and a bottom section for the `/predict` endpoint.

The `/health` endpoint is currently selected, showing a `GET` method and a `Health` description. Below it, the `/predict` endpoint is visible, showing a `POST` method and a `Predict` description. The `/predict` section includes a `Parameters` tab with "No parameters", a `Request body` tab with a `required` label and a dropdown menu set to `application/json`, and a `Schema` tab. The `Schema` tab displays a JSON schema for the request body, which includes a `title` and a `body` field. The `body` field is a string containing a detailed description of the predict endpoint, including a reproduction of an error and a standalone CUDA reproducer script.

At the bottom of the `/predict` section, there are `Execute` and `Clear` buttons. Below the `/predict` section, the `Code` and `Details` tabs are visible. The `Code` tab shows a `200` status code and a `Response body` containing a JSON array of labels and scores. The `Details` tab shows the `Response headers`, including `content-length: 169`, `content-type: application/json`, `date: Mon, 24 Aug 2026 16:07:32 GMT`, and `server: uvicorn`.

Response body:

```
{
  "labels": [
    {
      "label": "enhancement",
      "score": 0.3646749240251289
    },
    {
      "label": "oncall: pt2",
      "score": 0.3498626697174599
    },
    {
      "label": "bot-mislabeled",
      "score": 0.33277163165817353
    }
  ]
}
```

Response headers:

```
content-length: 169
content-type: application/json
date: Mon, 24 Aug 2026 16:07:32 GMT
server: uvicorn
```

Docker:

```

(.venv) ~/Documents/UCU/MLOPS/naysayer → docker ps -a

```
